## UNIT I – INTRODUCTION AND PROBLEM SOLVING

*Introduction to AI, Intelligent Agents, Problem Solving Agents, State Space Search, Uninformed Search Strategies: Breadth-first Search, Depth-first Search, Uniform Cost Search, Depth Limited Search, Iterative Deepening Search, Bidirectional Search*

### PART-A (2 Marks)

| Q.No. | Questions                                                                                         | BT Level | Competence    |
|-------|---------------------------------------------------------------------------------------------------|----------|---------------|
| 1     | Define Artificial Intelligence based on the 'Acting Rationally' approach.                         | BTL1     | Remembering   |
| 2     | What is the Turing Test, and what is its primary purpose in AI?                                   | BTL1     | Remembering   |
| 3     | List the four components of a PEAS description for an intelligent agent.                          | BTL1     | Remembering   |
| 4     | Distinguish between a fully observable and a partially observable environment.                    | BTL2     | Understanding |
| 5     | Define a rational agent and explain how rationality is measured.                                  | BTL1     | Remembering   |
| 6     | What are the five basic types of agent programs?                                                  | BTL1     | Remembering   |
| 7     | Identify the four criteria used to evaluate the performance of a search algorithm.                | BTL1     | Remembering   |
| 8     | Explain the concept of 'State Space' in the context of problem-solving agents.                    | BTL2     | Understanding |
| 9     | Why is Breadth-First Search (BFS) considered optimal for problems with constant step costs?       | BTL2     | Understanding |
| 10    | State the time and space complexity of Depth-First Search (DFS).                                  | BTL1     | Remembering   |
| 11    | How does Uniform Cost Search (UCS) differ from Breadth-First Search?                              | BTL2     | Understanding |
| 12    | What is the primary motivation behind using Depth Limited Search (DLS)?                           | BTL2     | Understanding |
| 13    | Define the term 'branching factor' in a search tree.                                              | BTL1     | Remembering   |
| 14    | Why is Iterative Deepening Search (IDS) preferred for large state spaces with unknown goal depth? | BTL2     | Understanding |
| 15    | Explain the basic idea of Bidirectional Search.                                                   | BTL2     | Understanding |
| 16    | What is the difference between a 'state' and a 'node' in search terminology?                      | BTL2     | Understanding |
| 17    | Define 'Problem Formulation' in the design of a problem-solving agent.                            | BTL1     | Remembering   |
| 18    | What is an 'episodic' environment in AI?                                                          | BTL1     | Remembering   |
| 19    | Mention one significant disadvantage of Bidirectional Search.                                     | BTL2     | Understanding |
| 20    | What is a 'Simple Reflex Agent'?                                                                  | BTL1     | Remembering   |

### PART-B (16 Marks)

| Q.No. | Questions                                                                                                                                            | Marks | BT Level | Competence |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------|-------|----------|------------|
| 1     | Explain the four different approaches to Artificial Intelligence: Thinking Humanly, Thinking Rationally, Acting Humanly, and Acting Rationally.      | (16)  | BTL4     | Analyzing  |
| 2     | Design a complete PEAS description and characterize the environment for an Autonomous Mars Rover and a Crossword Puzzle Solver.                      | (16)  | BTL6     | Creating   |
| 3     | Compare and contrast the architectures of Model-based Reflex Agents and Utility-based Agents with neat diagrams.                                     | (16)  | BTL4     | Analyzing  |
| 4     | Formulate the 8-puzzle problem as a state-space search problem, specifying the states, initial state, actions, transition model, and goal test.      | (16)  | BTL3     | Applying   |
| 5     | Describe the general 'Search-and-Execute' framework used by problem-solving agents and explain the importance of abstraction in problem formulation. | (16)  | BTL3     | Applying   |
| 6     | Provide a detailed comparative analysis of BFS, DFS, and UCS based on completeness, optimality, time complexity, and space complexity.               | (16)  | BTL4     | Analyzing  |

|    |                                                                                                                                                                     |      |      |            |
|----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|------|------------|
| 7  | Illustrate the step-by-step execution of Uniform Cost Search on a graph with varying edge costs and prove its optimality conditions.                                | (16) | BTL3 | Applying   |
| 8  | Critically evaluate the performance of Iterative Deepening Search (IDS). Why is it often considered the preferred uninformed search method for large search spaces? | (16) | BTL5 | Evaluating |
| 9  | Explain the mechanism of Bidirectional Search. Derive its time complexity and discuss the practical difficulties in its implementation.                             | (16) | BTL4 | Analyzing  |
| 10 | Analyze the impact of different environment properties (Deterministic vs. Stochastic, Static vs. Dynamic, Discrete vs. Continuous) on agent design.                 | (16) | BTL4 | Analyzing  |
| 11 | Design a Goal-based Agent for an automated warehouse robot. Explain how it differs from a simple reflex agent in terms of decision making.                          | (16) | BTL6 | Creating   |
| 12 | Demonstrate the execution of Depth Limited Search on a tree of depth 10 with a limit $L=4$ . Discuss what happens if the goal is at depth 6.                        | (16) | BTL3 | Applying   |
| 13 | Evaluate the Turing Test as a measure of machine intelligence. Discuss its strengths and the common criticisms raised against it.                                   | (16) | BTL5 | Evaluating |
| 14 | Derive the total number of nodes generated by Iterative Deepening Search in the worst case and compare it with the number of nodes in BFS.                          | (16) | BTL4 | Analyzing  |
| 15 | Explain the 'Vacuum-World' problem. Formulate it as a state space search and show the state space graph for a two-room configuration.                               | (16) | BTL3 | Applying   |
| 16 | Justify the use of Utility-based agents in environments where goals are not enough to make a high-quality decision, such as automated stock trading.                | (16) | BTL5 | Evaluating |
| 17 | Construct a search tree for the 'Missionaries and Cannibals' problem and explain how a search algorithm would find a solution.                                      | (16) | BTL6 | Creating   |
| 18 | Analyze the memory limitations of Breadth-First Search and explain how Depth-First Search manages to be more memory-efficient.                                      | (16) | BTL4 | Analyzing  |
| 19 | Compare the 'Atomic', 'Factored', and 'Structured' representations of states used by intelligent agents.                                                            | (16) | BTL4 | Analyzing  |
| 20 | Evaluate the trade-offs between time complexity and space complexity in search algorithms. Which is usually the more critical constraint in AI?                     | (16) | BTL5 | Evaluating |

## UNIT II – INFORMED SEARCH AND GAME PLAYING

*Heuristic Search, A\* Search, AO\* Search, Local Search Algorithms, Hill Climbing, Simulated Annealing, Genetic Algorithms, Adversarial Search, Game Playing, Minimax Algorithm, Alpha-Beta Pruning*

### PART-A (2 Marks)

| Q.No. | Questions                                                                                | BT Level | Competence    |
|-------|------------------------------------------------------------------------------------------|----------|---------------|
| 1     | Define a heuristic function and its role in informed search strategies.                  | BTL1     | Remembering   |
| 2     | State the condition for a heuristic to be considered admissible in A* search.            | BTL1     | Remembering   |
| 3     | Distinguish between informed search and uninformed search with an example.               | BTL2     | Understanding |
| 4     | What is the significance of the ' $f(n) = g(n) + h(n)$ ' formula in A* search?           | BTL2     | Understanding |
| 5     | Define an AND-OR graph and identify where it is primarily used.                          | BTL1     | Remembering   |
| 6     | Explain the concept of 'Local Optima' in the context of Hill Climbing.                   | BTL2     | Understanding |
| 7     | What is the role of the 'temperature' parameter in the Simulated Annealing algorithm?    | BTL2     | Understanding |
| 8     | List the three main genetic operators used in Genetic Algorithms.                        | BTL1     | Remembering   |
| 9     | Define 'Fitness Function' and its importance in evolutionary search.                     | BTL1     | Remembering   |
| 10    | What is a 'Zero-Sum' game in adversarial search?                                         | BTL1     | Remembering   |
| 11    | Explain the purpose of the Alpha and Beta values in Alpha-Beta pruning.                  | BTL2     | Understanding |
| 12    | Under what condition does Alpha-Beta pruning provide the maximum search space reduction? | BTL2     | Understanding |
| 13    | Define the 'Horizon Effect' in game playing algorithms.                                  | BTL1     | Remembering   |
| 14    | What is a 'Consistent' (or Monotonic) heuristic?                                         | BTL1     | Remembering   |
| 15    | Briefly explain the 'Plateau' problem in Hill Climbing search.                           | BTL2     | Understanding |
| 16    | How does AO* search differ from A* search in terms of the goal state?                    | BTL2     | Understanding |
| 17    | Define 'Ply' and 'Branching Factor' in the context of game trees.                        | BTL1     | Remembering   |
| 18    | What is the 'Crossover' operation in Genetic Algorithms?                                 | BTL2     | Understanding |
| 19    | State the Minimax decision rule for a MAX player.                                        | BTL1     | Remembering   |
| 20    | Identify the main drawback of the pure Hill Climbing algorithm.                          | BTL2     | Understanding |

### PART-B (16 Marks)

| Q.No. | Questions                                                                                                                                     | Marks | BT Level | Competence |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------|-------|----------|------------|
| 1     | Explain the A* search algorithm in detail. Prove that A* is optimal if the heuristic function is admissible.                                  | (16)  | BTL4     | Analyzing  |
| 2     | Describe the AO* algorithm for searching AND-OR graphs. Illustrate its working with a suitable example of problem decomposition.              | (16)  | BTL3     | Applying   |
| 3     | Compare and contrast Hill Climbing, Steepest-Ascent Hill Climbing, and Stochastic Hill Climbing. Discuss how they handle local maxima.        | (16)  | BTL4     | Analyzing  |
| 4     | Explain the Simulated Annealing process. How does the probability of accepting a worse move change over time, and why is this beneficial?     | (16)  | BTL4     | Analyzing  |
| 5     | Design a Genetic Algorithm to solve the 8-Queens problem. Specify the chromosome representation, fitness function, and selection mechanism.   | (16)  | BTL6     | Creating   |
| 6     | Trace the Minimax algorithm for a game tree of depth 3 with a branching factor of 2. Explain how the values are backed up to the root.        | (16)  | BTL3     | Applying   |
| 7     | Demonstrate the Alpha-Beta pruning process on a given game tree. Show the nodes pruned and explain the conditions that triggered the pruning. | (16)  | BTL3     | Applying   |

|    |                                                                                                                                                           |      |      |            |
|----|-----------------------------------------------------------------------------------------------------------------------------------------------------------|------|------|------------|
| 8  | Evaluate the impact of node ordering on the efficiency of Alpha-Beta pruning. What is the time complexity in the best and worst cases?                    | (16) | BTL5 | Evaluating |
| 9  | Analyze the trade-offs between using a simple heuristic versus a complex, computationally expensive heuristic in A* search.                               | (16) | BTL4 | Analyzing  |
| 10 | Discuss the 'Exploration vs. Exploitation' trade-off in Genetic Algorithms. How do mutation and crossover rates influence this balance?                   | (16) | BTL4 | Analyzing  |
| 11 | Develop a heuristic function for the 15-puzzle problem. Justify whether your heuristic is admissible and consistent.                                      | (16) | BTL6 | Creating   |
| 12 | Explain the concept of 'Heuristic Path Algorithm' and how it generalizes both Breadth-First Search and Dijkstra's algorithm.                              | (16) | BTL4 | Analyzing  |
| 13 | Critically examine the limitations of the Minimax algorithm in games with high branching factors like Go or Chess. Suggest potential improvements.        | (16) | BTL5 | Evaluating |
| 14 | Propose a modified version of Hill Climbing that incorporates a 'tabu list' to avoid cycles. Explain how this improves search performance.                | (16) | BTL6 | Creating   |
| 15 | Compare the memory requirements and completeness of A* search with Iterative Deepening A* (IDA*).                                                         | (16) | BTL4 | Analyzing  |
| 16 | Explain how Simulated Annealing can be viewed as a search that mimics the physical process of cooling metals. Derive the acceptance probability formula.  | (16) | BTL4 | Analyzing  |
| 17 | Design an evaluation function for a game of Tic-Tac-Toe. How would this function be used by a Minimax agent to choose the next move?                      | (16) | BTL6 | Creating   |
| 18 | Evaluate the performance of Genetic Algorithms in solving the Traveling Salesperson Problem (TSP) compared to traditional local search methods.           | (16) | BTL5 | Evaluating |
| 19 | Analyze the behavior of the A* algorithm when the heuristic function $h(n)$ is always zero. Which uninformed search does it become?                       | (16) | BTL4 | Analyzing  |
| 20 | Formulate a search strategy for a multi-agent adversarial environment where players do not have perfect information. Contrast this with standard Minimax. | (16) | BTL6 | Creating   |

## UNIT III – KNOWLEDGE REPRESENTATION AND LOGIC

*Knowledge-Based Agents, Propositional Logic, First-Order Logic, Inference in FOL, Forward Chaining, Backward Chaining, Resolution, Unification, Knowledge Representation Issues*

### PART-A (2 Marks)

| Q.No. | Questions                                                                               | BT Level | Competence    |
|-------|-----------------------------------------------------------------------------------------|----------|---------------|
| 1     | Define a Knowledge-Based Agent and its two primary components.                          | BTL1     | Remembering   |
| 2     | Distinguish between the 'declarative' and 'procedural' approaches to building an agent. | BTL2     | Understanding |
| 3     | What is meant by 'entailment' in the context of formal logic?                           | BTL1     | Remembering   |
| 4     | Define 'soundness' and 'completeness' for an inference algorithm.                       | BTL1     | Remembering   |
| 5     | Explain the difference between a 'valid' sentence and a 'satisfiable' sentence.         | BTL2     | Understanding |
| 6     | State the purpose of the 'Wumpus World' environment in AI studies.                      | BTL1     | Remembering   |
| 7     | List the basic elements of First-Order Logic (FOL) syntax.                              | BTL1     | Remembering   |
| 8     | What is a 'Most General Unifier' (MGU) in the context of unification?                   | BTL2     | Understanding |
| 9     | Define 'Skolemization' and its role in logic conversion.                                | BTL1     | Remembering   |
| 10    | What is a 'Horn Clause' and why is it significant for inference?                        | BTL2     | Understanding |
| 11    | Briefly explain the 'Frame Problem' in knowledge representation.                        | BTL2     | Understanding |
| 12    | Define the 'Resolution' rule of inference.                                              | BTL1     | Remembering   |
| 13    | What is the difference between a 'constant' and a 'function' symbol in FOL?             | BTL2     | Understanding |
| 14    | Define 'Forward Chaining' in the context of production systems.                         | BTL1     | Remembering   |
| 15    | What is 'Backward Chaining' and how does it differ from Forward Chaining?               | BTL2     | Understanding |
| 16    | List two major issues in Knowledge Representation (KR).                                 | BTL1     | Remembering   |
| 17    | Explain the concept of 'Model' in Propositional Logic.                                  | BTL2     | Understanding |
| 18    | What is 'Inferential Adequacy' in a knowledge representation scheme?                    | BTL1     | Remembering   |
| 19    | Define 'Universal Quantification' and 'Existential Quantification'.                     | BTL1     | Remembering   |
| 20    | Explain the 'Closed World Assumption' (CWA) in logic-based systems.                     | BTL2     | Understanding |

### PART-B (16 Marks)

| Q.No. | Questions                                                                                                                                                                                           | Marks | BT Level | Competence |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|----------|------------|
| 1     | Describe the general architecture of a Knowledge-Based Agent. Illustrate how such an agent functions within the Wumpus World environment, detailing the TELL and ASK operations.                    | (16)  | BTL3     | Applying   |
| 2     | Compare Propositional Logic and First-Order Logic. Analyze why Propositional Logic is insufficient for representing complex domains and how FOL addresses these limitations.                        | (16)  | BTL4     | Analyzing  |
| 3     | Explain the process of converting a First-Order Logic sentence into Conjunctive Normal Form (CNF). Provide a step-by-step derivation for a complex sentence involving quantifiers and implications. | (16)  | BTL3     | Applying   |
| 4     | Detailed the Unification algorithm. Given the literals $P(a, x, f(g(y)))$ and $P(z, h(z, w), f(w))$ , demonstrate the step-by-step execution of the algorithm to find the MGU.                      | (16)  | BTL3     | Applying   |
| 5     | Critically evaluate the Resolution Refutation method in FOL. Prove the statement 'Socrates is mortal' given 'All men are mortal' and 'Socrates is a man' using resolution.                          | (16)  | BTL5     | Evaluating |
| 6     | Analyze the Forward Chaining algorithm for definite clauses. Discuss its data-driven nature and illustrate its execution with a sample knowledge base and a target goal.                            | (16)  | BTL4     | Analyzing  |

|    |                                                                                                                                                                                                                   |      |      |            |
|----|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|------|------------|
| 7  | Examine the Backward Chaining algorithm. Explain its goal-directed nature and discuss the potential issues of redundant computations and infinite loops in logic programming.                                     | (16) | BTL4 | Analyzing  |
| 8  | Design a First-Order Logic Knowledge Base for a 'Smart Library System' that handles book loans, member categories, and overdue fines. Include at least five distinct rules.                                       | (16) | BTL6 | Creating   |
| 9  | Discuss the various issues in Knowledge Representation, specifically focusing on Granularity, Set of Objects, and the Qualification problem. Provide examples for each.                                           | (16) | BTL4 | Analyzing  |
| 10 | Explain the Generalized Modus Ponens (GMP). Justify why GMP is more efficient than standard Modus Ponens when dealing with First-Order Logic inference.                                                           | (16) | BTL5 | Evaluating |
| 11 | Analyze the semantics of nested quantifiers in FOL. Evaluate how the swapping of universal and existential quantifiers changes the meaning of a sentence with concrete examples.                                  | (16) | BTL4 | Analyzing  |
| 12 | Develop a resolution-based proof to solve the 'Crime Investigation' problem: If the suspect is guilty, he was at the scene. If he was at the scene, he has a motive. Prove guilt given motive and scene presence. | (16) | BTL6 | Creating   |
| 13 | Evaluate the trade-offs between 'Model Checking' and 'Theorem Proving' as strategies for logical inference in large-scale knowledge bases.                                                                        | (16) | BTL5 | Evaluating |
| 14 | Explain the concept of 'Representational Adequacy' and 'Inferential Efficiency'. Discuss how these two factors conflict when choosing a logic-based representation.                                               | (16) | BTL4 | Analyzing  |
| 15 | Implement a logical representation for the 'Kinship' domain. Define predicates for parent, sibling, grandparent, and cousin using FOL and show how 'grandparent' is inferred.                                     | (16) | BTL6 | Creating   |
| 16 | Compare the efficiency of Forward Chaining and Backward Chaining in terms of time complexity and space complexity for a tree-structured knowledge base.                                                           | (16) | BTL4 | Analyzing  |
| 17 | Justify the use of 'Equality' in FOL. Explain the 'Paramodulation' and 'Demodulation' techniques used to handle equality in automated reasoning systems.                                                          | (16) | BTL5 | Evaluating |
| 18 | Construct a Knowledge-Based Agent for the 'Electronic Circuits' domain. Describe how the agent can diagnose a faulty gate using logical inference.                                                                | (16) | BTL6 | Creating   |
| 19 | Analyze the 'Ramification Problem' and 'Modification Problem' in the context of dynamic environments where facts change over time.                                                                                | (16) | BTL4 | Analyzing  |
| 20 | Critique the use of First-Order Logic for representing 'Common Sense' knowledge. Suggest how extensions to FOL might handle exceptions and defaults.                                                              | (16) | BTL5 | Evaluating |

## UNIT IV – KNOWLEDGE REPRESENTATION AND PLANNING

*Ontological Engineering, Categories and Objects, Events, Mental Objects and Belief Systems, Reasoning with Default Information, Classical Planning, Planning as State-Space Search, Planning Graphs*

### PART-A (2 Marks)

| Q.No. | Questions                                                                        | BT Level | Competence    |
|-------|----------------------------------------------------------------------------------|----------|---------------|
| 1     | Define Ontological Engineering and its significance in AI.                       | BTL1     | Remembering   |
| 2     | Distinguish between a general-purpose ontology and a domain-specific ontology.   | BTL2     | Understanding |
| 3     | What is meant by 'Subsumption' in the context of categories?                     | BTL1     | Remembering   |
| 4     | Explain the concept of 'Fluents' in situation calculus.                          | BTL2     | Understanding |
| 5     | What is the 'Frame Problem' in knowledge representation?                         | BTL1     | Remembering   |
| 6     | Define 'Reification' and provide a simple example of its use.                    | BTL2     | Understanding |
| 7     | What are 'Mental Objects' in the context of belief systems?                      | BTL1     | Remembering   |
| 8     | Explain the 'Referential Transparency' issue in belief logic.                    | BTL2     | Understanding |
| 9     | Define Non-monotonic reasoning.                                                  | BTL1     | Remembering   |
| 10    | What is 'Circumscription' in default reasoning?                                  | BTL2     | Understanding |
| 11    | List the four components of a classical planning problem.                        | BTL1     | Remembering   |
| 12    | Differentiate between the Open World Assumption and the Closed World Assumption. | BTL2     | Understanding |
| 13    | What is 'Progression Planning' in state-space search?                            | BTL1     | Remembering   |
| 14    | Define 'Regression Planning' and state its primary advantage.                    | BTL2     | Understanding |
| 15    | What is a 'Planning Graph'?                                                      | BTL1     | Remembering   |
| 16    | Explain the concept of 'Mutex' (Mutual Exclusion) in planning graphs.            | BTL2     | Understanding |
| 17    | What does it mean for a planning graph to 'Level Off'?                           | BTL1     | Remembering   |
| 18    | Define the 'Qualification Problem' in action representation.                     | BTL1     | Remembering   |
| 19    | State the difference between 'Actions' and 'Events' in ontological terms.        | BTL2     | Understanding |
| 20    | What is a 'Literal' in PDDL (Planning Domain Definition Language)?               | BTL1     | Remembering   |

### PART-B (16 Marks)

| Q.No. | Questions                                                                                                                                                                        | Marks | BT Level | Competence |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|----------|------------|
| 1     | Elaborate on the process of Ontological Engineering. Discuss the challenges involved in creating a comprehensive Upper Ontology for diverse domains.                             | (16)  | BTL4     | Analyzing  |
| 2     | Demonstrate how First-Order Logic can be used to represent Categories, Measures, and Composite Objects. Provide a formal representation for a 'Smart Warehouse' inventory.       | (16)  | BTL3     | Applying   |
| 3     | Analyze the Situation Calculus framework. Explain how it handles the representation of change, and discuss its solutions to the Frame, Ramification, and Qualification problems. | (16)  | BTL4     | Analyzing  |
| 4     | Evaluate the use of Modal Logic for representing Mental Objects and Belief Systems. How does it resolve the issue of logical omniscience?                                        | (16)  | BTL5     | Evaluating |
| 5     | Compare and contrast Default Logic and Circumscription as formalisms for non-monotonic reasoning. Provide examples where one is preferred over the other.                        | (16)  | BTL4     | Analyzing  |
| 6     | Design a complete PDDL domain and problem description for a 'Robot Courier' that must move packages between rooms, considering battery constraints.                              | (16)  | BTL6     | Creating   |
| 7     | Analyze the efficiency of Forward State-Space Search versus Backward State-Space Search. Under what conditions does Regression Planning outperform Progression?                  | (16)  | BTL4     | Analyzing  |

|    |                                                                                                                                                                         |      |      |            |
|----|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|------|------------|
| 8  | Construct a Planning Graph for a simple 'Spare Tire' problem. Detail the literal levels, action levels, and the derivation of mutex relations.                          | (16) | BTL6 | Creating   |
| 9  | Explain the GraphPlan algorithm in detail. Discuss how it uses the planning graph to extract a valid plan and how it handles backtracking.                              | (16) | BTL3 | Applying   |
| 10 | Evaluate the various heuristics derived from Planning Graphs, such as Max-level, Level-sum, and Set-level heuristics, for their admissibility and effectiveness.        | (16) | BTL5 | Evaluating |
| 11 | Develop a knowledge representation schema for 'Time and Intervals' using Allen's Interval Algebra. Show how it can be used to reason about overlapping events.          | (16) | BTL6 | Creating   |
| 12 | Discuss the 'Blocks World' problem in classical planning. Formulate the STRIPS operators and show the step-by-step state transitions for a specific goal configuration. | (16) | BTL3 | Applying   |
| 13 | Analyze the impact of the 'Closed World Assumption' on the complexity of reasoning in large-scale knowledge bases. Contrast this with the 'Unique Names Assumption'.    | (16) | BTL4 | Analyzing  |
| 14 | Critique the use of Semantic Networks versus Description Logics for representing taxonomic knowledge. Which is more suitable for automated reasoning and why?           | (16) | BTL5 | Evaluating |
| 15 | Design a reasoning system that uses 'Default Information' to handle exceptions in a biological taxonomy (e.g., 'Birds fly, but ostriches do not').                      | (16) | BTL6 | Creating   |
| 16 | Explain the concept of 'Planning as Satisfiability' (SatPlan). How are planning problems translated into propositional logic formulas?                                  | (16) | BTL3 | Applying   |
| 17 | Analyze the role of 'Heuristic Search' in planning. Explain the 'Ignore Preconditions' and 'Independent Subgoals' heuristics with suitable examples.                    | (16) | BTL4 | Analyzing  |
| 18 | Evaluate the limitations of Classical Planning when applied to real-world environments characterized by uncertainty and exogenous events.                               | (16) | BTL5 | Evaluating |
| 19 | Construct a formal representation for 'Knowledge and Belief' using Kripke structures (Possible Worlds Semantics). Explain how accessibility relations define belief.    | (16) | BTL6 | Creating   |
| 20 | Compare the expressiveness of PDDL with earlier languages like STRIPS and ADL. Discuss how PDDL handles conditional effects and universal quantification.               | (16) | BTL4 | Analyzing  |

## UNIT V – UNCERTAIN KNOWLEDGE AND REASONING

*Acting under Uncertainty, Basic Probability Notation, Bayes' Rule, Probabilistic Reasoning, Bayesian Networks, Semantics of Bayesian Networks, Exact Inference in Bayesian Networks, Approximate Inference, Causal Networks*

### PART-A (2 Marks)

| Q.No. | Questions                                                                        | BT Level | Competence    |
|-------|----------------------------------------------------------------------------------|----------|---------------|
| 1     | Define uncertainty in the context of Artificial Intelligence.                    | BTL1     | Remembering   |
| 2     | State the product rule and the sum rule of probability.                          | BTL1     | Remembering   |
| 3     | What is the difference between prior probability and posterior probability?      | BTL2     | Understanding |
| 4     | Write the mathematical expression for Bayes' Rule and identify its components.   | BTL1     | Remembering   |
| 5     | Define a Bayesian Network and list its two main components.                      | BTL1     | Remembering   |
| 6     | Explain the concept of conditional independence between two random variables.    | BTL2     | Understanding |
| 7     | What is a Joint Probability Distribution (JPD)?                                  | BTL1     | Remembering   |
| 8     | Define the Markov condition in a Bayesian Network.                               | BTL2     | Understanding |
| 9     | What is meant by 'Exact Inference' in probabilistic reasoning?                   | BTL1     | Remembering   |
| 10    | List two common algorithms used for approximate inference in Bayesian Networks.  | BTL1     | Remembering   |
| 11    | Explain the role of a Conditional Probability Table (CPT) in a Bayesian Network. | BTL2     | Understanding |
| 12    | Define a Causal Network and how it differs from a simple correlation.            | BTL1     | Remembering   |
| 13    | What is the purpose of normalization in the context of Bayes' Rule?              | BTL2     | Understanding |
| 14    | Define 'Evidence' and 'Query' variables in the context of inference.             | BTL1     | Remembering   |
| 15    | What is Rejection Sampling in approximate inference?                             | BTL1     | Remembering   |
| 16    | Explain the concept of Likelihood Weighting.                                     | BTL2     | Understanding |
| 17    | Why is exact inference computationally difficult (NP-hard) in general networks?  | BTL2     | Understanding |
| 18    | Define the term 'd-separation' in Bayesian Networks.                             | BTL1     | Remembering   |
| 19    | What is a Directed Acyclic Graph (DAG) in the context of Bayesian Networks?      | BTL1     | Remembering   |
| 20    | Explain the significance of the 'Chain Rule' for Bayesian Networks.              | BTL2     | Understanding |

### PART-B (16 Marks)

| Q.No. | Questions                                                                                                                                                                                   | Marks | BT Level | Competence |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|----------|------------|
| 1     | Explain the process of acting under uncertainty and justify why classical logic fails in uncertain domains.                                                                                 | (16)  | BTL5     | Evaluating |
| 2     | Derive the Bayes' Rule from the product rule and demonstrate its application in a medical diagnosis scenario where a test result is given.                                                  | (16)  | BTL3     | Applying   |
| 3     | Describe the semantics of Bayesian Networks and explain how they represent a full joint probability distribution using the local semantics approach.                                        | (16)  | BTL4     | Analyzing  |
| 4     | Design a Bayesian Network for a 'Smart Home Alarm System' involving variables: Burglary, Earthquake, Alarm, JohnCalls, and MaryCalls. Define the network structure and provide sample CPTs. | (16)  | BTL6     | Creating   |
| 5     | Explain the Inference by Enumeration algorithm in detail and analyze its time and space complexity for a network with 'n' Boolean variables.                                                | (16)  | BTL4     | Analyzing  |
| 6     | Discuss the Variable Elimination algorithm for exact inference and illustrate its steps using a specific query on a small network.                                                          | (16)  | BTL3     | Applying   |

|    |                                                                                                                                                               |      |      |            |
|----|---------------------------------------------------------------------------------------------------------------------------------------------------------------|------|------|------------|
| 7  | Compare and contrast Rejection Sampling and Likelihood Weighting. Evaluate which method is more efficient when evidence is rare.                              | (16) | BTL5 | Evaluating |
| 8  | Explain the Gibbs Sampling algorithm and describe how it uses Markov Chain Monte Carlo (MCMC) for approximate inference.                                      | (16) | BTL3 | Applying   |
| 9  | Analyze the role of Causal Networks in AI. How does a causal model differ from a purely diagnostic model in terms of structure and reasoning?                 | (16) | BTL4 | Analyzing  |
| 10 | Develop a complete probabilistic model for a 'Car Starting' problem involving Battery, Fuel, SparkPlugs, and Starter. Formulate the conditional dependencies. | (16) | BTL6 | Creating   |
| 11 | Evaluate the impact of node ordering on the compactness of a Bayesian Network. Provide an example where a poor ordering leads to a more complex graph.        | (16) | BTL5 | Evaluating |
| 12 | Explain the concept of 'Independence' and 'Conditional Independence' using basic probability notation and prove how they simplify the joint distribution.     | (16) | BTL4 | Analyzing  |
| 13 | Describe the process of constructing a Bayesian Network from a set of variables and explain how to determine if the resulting structure is optimal.           | (16) | BTL3 | Applying   |
| 14 | Analyze the 'Polytree' structure in Bayesian Networks and explain why exact inference is efficient in such networks compared to multiply connected networks.  | (16) | BTL4 | Analyzing  |
| 15 | Justify the use of approximate inference methods over exact inference for large-scale real-world applications like weather forecasting.                       | (16) | BTL5 | Evaluating |
| 16 | Explain the d-separation criterion in detail and use it to identify all independent variables in a given complex Bayesian Network structure.                  | (16) | BTL4 | Analyzing  |
| 17 | Formulate the mathematical steps for calculating the posterior distribution $P(\text{Query} \mid \text{Evidence})$ using the Likelihood Weighting algorithm.  | (16) | BTL3 | Applying   |
| 18 | Create a comparative study of different sampling methods (Direct, Rejection, Likelihood, Gibbs) used in probabilistic reasoning.                              | (16) | BTL6 | Creating   |
| 19 | Explain how Bayesian Networks can be used for both diagnostic reasoning (bottom-up) and causal reasoning (top-down).                                          | (16) | BTL3 | Applying   |
| 20 | Analyze the relationship between the topology of a Bayesian Network and the conditional independence assumptions it encodes.                                  | (16) | BTL4 | Analyzing  |
